Exp 12: Implementing Security Features and Governance / Administration Practices in Zoho Creator

1. Aim

To design and verify privacy, access, audit, and administration controls for the **Loan Application & Pre-Screening Management** app. The form collects identity, contact, income, liability, and credit-check consent data, so access to Loan_Application_Report must be limited to authorized bank staff.

2. Procedure

Step 1: Classify personal and financial fields

Review Loan_Application_Form and identify Applicant_Name, Date_Of_Birth, PAN_Number, Residential_Address, Contact_Number, Email_Address, Monthly_Income, Existing_Liabilities, and Consent_For_Credit_Check as sensitive. Apply Creator-supported personal data settings, masking, and field permissions as available in the tenant.

Step 2: Define roles and report access

Give prospective borrowers access to submit the form but no ability to browse submitted records. Give loan officers only the report and actions required for pre-screening. Reserve schema changes, exports, and permission administration for designated administrators.

Step 3: Enable accountability

Review audit facilities for authentication, record creation and changes, report export, workflow changes, and permission changes. Include a case reference in logs while keeping PAN and income values out of free-text log messages.

Step 4: Protect integrations and retention

Use a protected connection for acknowledgement email and any later credit bureau integration. Define backup, retention, and deletion policies with the bank's compliance team. Preserve the consent timestamp and policy version when credit-check processing is introduced.

> Security settings and retention periods are proposed controls. Verify the options supported by the Zoho Creator plan and the bank's actual policy before configuring them.

3. Output

3.1 Field protection matrix

Field	Classification	Recommended control	Routine visibility
Applicant_Name, Date_Of_Birth	Identity	Role-restricted view and audit	Loan officer
PAN_Number	Government identifier	Mask in views; restrict export	Authorized verifier
Contact_Number, Email_Address	Contact data	Limit report access; use only for service messages	Loan officer
Residential_Address	Location / identity	Role-restricted view	Loan officer
Monthly_Income, Existing_Liabilities	Financial data	Restrict report and export	Loan officer
Consent_For_Credit_Check	Consent record	Timestamp and policy version in later workflow	Compliance / loan officer

3.2 Role permissions

Role	Form submit	Read report	Export	Change schema
Prospective borrower	Yes	No	No	No
Loan officer	As needed	Assigned cases	By policy	No
Administrator	Yes	Controlled	By policy	Yes
Auditor	No	Read-only as approved	By policy	No

Public form submission does not imply public access to submitted application records.

3.3 Audit events and governance controls

Event or control	Evidence to retain	Purpose
Application submitted	Case reference, time, source	Trace intake
Consent captured	Checked state, timestamp, policy version	Support credit-check authorization
Record viewed or changed	Actor, case reference, time	Accountability
Report exported	Actor, scope, time	Detect unnecessary data copies
Role or workflow changed	Admin, change, time	Govern configuration
Backup and retention	Schedule, restore test, deletion rule	Recovery and minimization

4. Result / Observations

1. The loan application needs stronger field and report controls because it contains identity and financial data.
2. Consent must be captured before a credit bureau check; the checkbox alone does not prove that a check occurred.
3. Audit trails, least-privilege roles, backups, and export controls make the pre-screening process reviewable.

Complete the matrix with screenshots and audit entries after implementing these settings in the bank’s Creator environment.
