# Exp 13: Case Study on the Limitations of Low-Code Platforms for a Complex Enterprise Use Case

## 1. Aim

To evaluate where the Zoho Creator **Loan Application & Pre-Screening Management** app is sufficient and where a larger bank loan-origination system requires separate services. The case extends Main_ref's single online form to high-volume intake, identity verification, document handling, bureau connectivity, decision support, and regulatory audit.

## 2. Procedure

### Step 1: Define the enterprise scenario

Borrowers submit Loan_Application_Form across branches and digital channels. Loan officers use Loan_Application_Report to filter by Loan_Type and Monthly_Income, contact applicants at Preferred_Callback_Time, and request document verification. At larger scale, the bank must also coordinate duplicate checks, identity services, bureau requests, case assignment, and long-term records.

### Step 2: Identify architecture boundaries

- **Data sensitivity:** PAN_Number, Date_Of_Birth, income, and liabilities require strict access, encryption, and retention controls.
- **External dependencies:** Bureau and identity checks may be slow, unavailable, or governed by contracts and consent requirements.
- **Transaction control:** Multiple systems must agree on case state without duplicate application or credit-check requests.
- **Complex rules:** Product eligibility and affordability policies need versioned, explainable decisions and human oversight.

### Step 3: Design a hybrid model

Keep form capture, validation, report views, and officer workflow in Creator. Move integration orchestration, document processing, and policy evaluation to bank-controlled services with audit-ready APIs and queues.

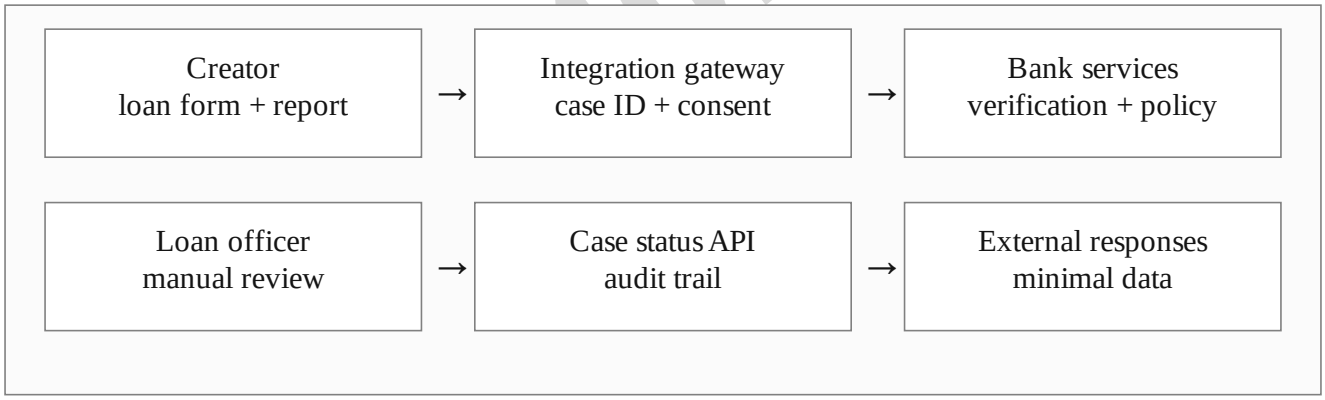
# 3. Output

## 3.1 Limitation and mitigation matrix

| Enterprise need | Low-code fit | Risk or constraint | Recommended boundary |
|---|---|---|---|
| Applicant intake | Strong | Sensitive fields and access rules | Creator form with restricted report |
| Bureau / identity calls | Integration possible | Latency, failure, consent, idempotency | Dedicated gateway and queue |
| Document verification | Basic workflow | OCR and secure file handling | Specialized document service |
| Decision policy | Simple checks | Versioning, explainability, review | Bank policy engine + human officer |
| Cross-system audit | Partial local logs | End-to-end trace across services | Central audit store |
| High-volume analytics | Report filters | Heavy joins and history | Warehouse / analytics service |

## 3.2 Data and process boundaries



0101027

### 3.3 Responsibility split

| Layer | Assigned responsibility | Data exchanged |
|---|---|---|
| Zoho Creator | Collect 13 fields, validate, send acknowledgement, show loan officer report | Application reference and approved fields |
| Gateway / queue | Authenticate, deduplicate, retry, and route requests | Tokenized case reference and consent metadata |
| Bank services | Document verification, bureau integration, policy versioning | Minimum required personal data |
| Audit and analytics | Track lifecycle and analyze aggregate performance | Events with controlled identifiers |

## 4. Result / Observations

1. Creator is a practical intake and officer workflow layer for the use case in Main_ref.
2. High-stakes decisions, external financial checks, and complex cross-system transactions need specialized services and bank governance.
3. The application should present pre-screening status as a human review aid. Submission or a rule check must never be described as loan approval.

The exact platform capacity and feature limits must be measured in the chosen Zoho Creator plan and workload; no unverified numerical limit is assumed here.
