Exp 9: Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator

1. Aim

To explore how AI-assisted features and built-in analytics can support the **Loan Application & Pre-Screening Management** app in Zoho Creator. The exercise uses **Loan_Application_Form** and **Loan_Application_Report** to design operational dashboards, test natural-language analysis, evaluate document extraction, and review AI-assisted Deluge development.

2. Procedure

Step 1: Configure built-in analytics

Create a restricted loan-officer dashboard from Loan_Application_Report. Add KPI cards for total applications and pending callbacks, a chart grouped by Loan_Type, and a chart grouped by Employment_Type. Use aggregate values only where borrower-level details are unnecessary.

Step 2: Evaluate natural-language analysis

Test plain-language questions against non-production records, such as “Show application count by Loan Type,” “List applications with Monthly Income above 50000,” and “Show callbacks scheduled after 4 PM.” Compare the generated filters and totals with a manually configured report.

Step 3: Evaluate document extraction

If the Creator plan provides a supported OCR or AI extraction feature, test it with synthetic or redacted documents. Candidate documents include an identity proof, PAN image, income proof, and address proof. Keep extracted values in a review state until a loan officer confirms them.

Step 4: Review AI code assistance

Use the available script assistant to draft or explain validation and workflow logic. Review every suggested field link name, condition, and API call before saving. Test the final script with valid, invalid, and missing input values.

Step 5: Apply privacy and decision controls

Restrict dashboards and AI features to authorized roles. Do not send PAN, address, income, liabilities, or date of birth to an unapproved model or connector. Treat AI results as review aids; a chart, extraction result, or generated rule must not be presented as loan approval.

3. Output

3.1 Loan Dashboard Configuration

Widget	Source field	Aggregation	Operational use
KPI: Total Applications	Record ID	Count of authorized report rows	Monitor enquiry volume
KPI: Pending Callbacks	Preferred_Callback_Time	Count within selected callback window	Plan officer calls
Donut: Loan Type Distribution	Loan_Type	Count grouped by category	Understand product interest
Bar: Employment Mix	Employment_Type	Count grouped by category	Review applicant profile mix
Table: Income Bands	Monthly_Income	Grouped ranges after access control	Support workload planning

The dashboard should show only the records permitted for the logged-in loan officer. PAN_Number, Residential_Address, Existing_Liabilities, and free-text Purpose_Of_Loan are excluded from summary widgets.

3.2 Natural-Language Query Evaluation Plan

Prompt	Expected interpretation	Manual verification
“Show application count by Loan Type”	Group Loan_Application_Report by Loan_Type and count rows	Compare category totals with a standard summary report
“List applications with Monthly Income above 50000”	Filter Monthly_Income > 50000	Check boundary values and authorized row count
“Show callbacks scheduled after 4 PM”	Filter Preferred_Callback_Time after 16:00	Compare with a manually filtered callback view
“Show self-employed home-loan enquiries”	Employment_Type = Self-Employed and Loan_Type = Home Loan	Verify both criteria are applied together

> Record the generated query, returned row count, expected row count, and any correction required. Feature names and availability vary by Zoho Creator plan and account configuration, so verify them in the actual workspace.

3.3 Document Extraction and Human Review Matrix

Document	Candidate value	Validation before use	Storage rule
PAN image	PAN_Number	Format check and officer comparison with original	Restrict and mask
Identity proof	Applicant_Name / Date_Of_Birth	Match form entry; verify applicant is at least 18	Role-restricted access
Income proof	Monthly_Income	Officer confirms period, source, and amount	Financial-data controls
Address proof	Residential_Address	Officer checks completeness and recency	Do not expose in public report

An extracted value remains unverified until an authorized reviewer accepts it. Low confidence, mismatched values, unsupported files, and unreadable images must be routed to manual entry.

3.4 AI Feature Test Record

Test area	Evidence to capture	Pass condition
Dashboard	Widget configuration and aggregate totals	Totals equal the approved report
Natural-language query	Prompt, generated criteria, result count	Criteria and results match manual query
Document extraction	Redacted input, extracted value, reviewer decision	No value accepted without review
Code assistance	Suggestion, final reviewed script, test cases	Script passes positive and negative tests
Access control	Role and visibility test	Unauthorized users cannot view applicant data

4. Result / Observations

1. Built-in charts can summarize loan enquiry volume, product interest, employment type, and callback workload without exposing unnecessary borrower details.
2. Natural-language analysis is useful only when its generated criteria and totals are checked against a standard report.
3. OCR can reduce manual typing for applicant documents, but extracted identity and income values require human verification.
4. AI-generated Deluge suggestions must be reviewed for field names, privacy, error handling, and business meaning.
5. No AI output in this workflow represents loan eligibility, credit approval, or a completed bureau check.

Populate the evaluation tables with screenshots and measured results from the actual Zoho Creator account. The supplied reference does not contain executed Zia logs or verified OCR measurements.
