Exp 6: Automating Business Processes using Deluge Scripting and Workflows, with Application Testing and Debugging

1. Aim

To configure and test an automated acknowledgement workflow in the **Loan Application & Pre-Screening Management** application. After a valid record is created in **Loan_Application_Form**, Zoho Creator sends an acknowledgement to Email_Address and records evidence for debugging and verification.

2. Procedure

24140127

Step 1: Create the Form Workflow

Open the application's **Workflow** tab and create a new form workflow with the following settings:

- **Form:** Loan_Application_Form
- **Record event:** Created
- **Form event:** Successful form submission
- **Workflow name:** Send application acknowledgement

This trigger runs only after the loan enquiry passes the mandatory, email, phone, adult-age, positive-income, loan-type, and consent validations defined for the form.

Step 2: Add the Email Action

Select **Add New Action**, open the **Notification** category, and choose **Send email**. Keep the action directly under the successful-submission trigger unless an additional business condition is required.

Step 3: Configure the Acknowledgement

Map the recipient to **Email_Address**. Use the subject **Loan Application Received** and a message that confirms receipt, identifies the Creator application reference, and explains that a loan officer will contact the applicant for document verification.

Email Content and Privacy Controls

The acknowledgement must not include PAN_Number, Date_Of_Birth, Residential_Address, Monthly_Income, Existing_Liabilities, or other sensitive values. It must not state that the loan is approved or that a credit-bureau check has been completed.

Email element	Loan workflow value
To	Email_Address
Subject	Loan Application Received
Purpose	Confirm successful intake and describe the next step
Safe dynamic values	Applicant name and internal application reference, if approved
Excluded values	PAN, date of birth, address, income, liabilities, bureau data

Step 4: Review and Enable

Inspect the workflow canvas and verify that the trigger connects to one Send email action. Save the action, finish the workflow, and confirm that it appears under Loan_Application_Form with Enabled status.

Step 5: Test and Debug

- Submit a valid application and confirm exactly one acknowledgement is delivered.
- Submit an invalid email address and confirm form validation prevents execution.
- Leave the consent checkbox unchecked and confirm submission is blocked.
- Check the delivered subject, recipient, application reference, and next-step wording.
- Inspect workflow logs for failed delivery and verify that failures do not delete the submitted loan record.
- Repeat a test carefully to confirm that duplicate acknowledgements are not sent for the same creation event.

3. Output

The screenshots below use loan-application labels for the form, workflow, and delivered email.

2414027

3.1 Workflow Trigger Configuration

The initial workflow modal targets Loan_Application_Form, the Created record event, successful form submission, and the acknowledgement workflow name.

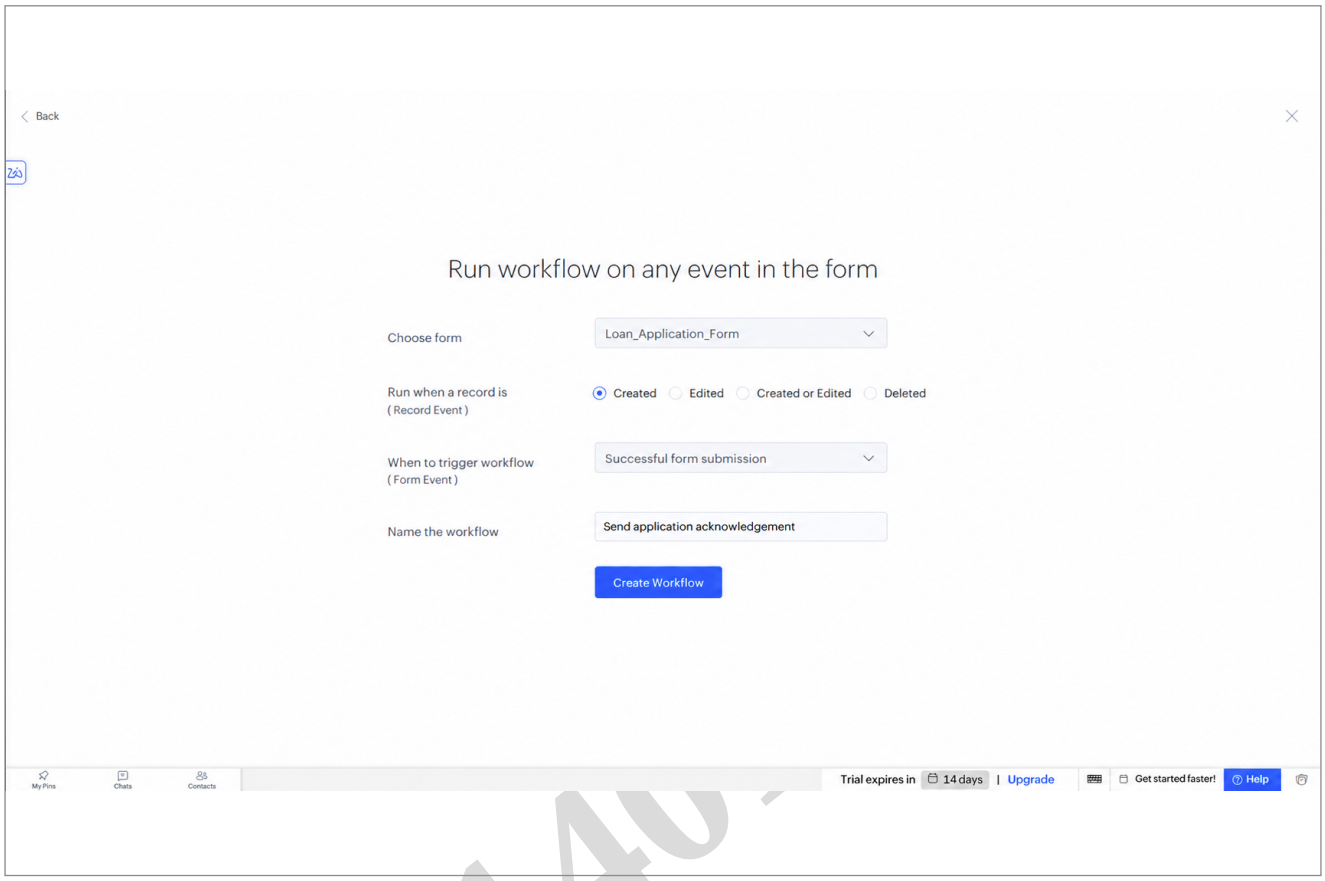

Figure 1: Trigger configuration for “Send application acknowledgement”

Trigger Verification

Setting	Required value	Reason
Form	Loan_Application_Form	Runs for the loan intake record
Record event	Created	Acknowledges a new enquiry
Form event	Successful form submission	Runs after validation
Workflow name	Send application acknowledgement	Clearly identifies the action

3.2 Select Notification > Send Email

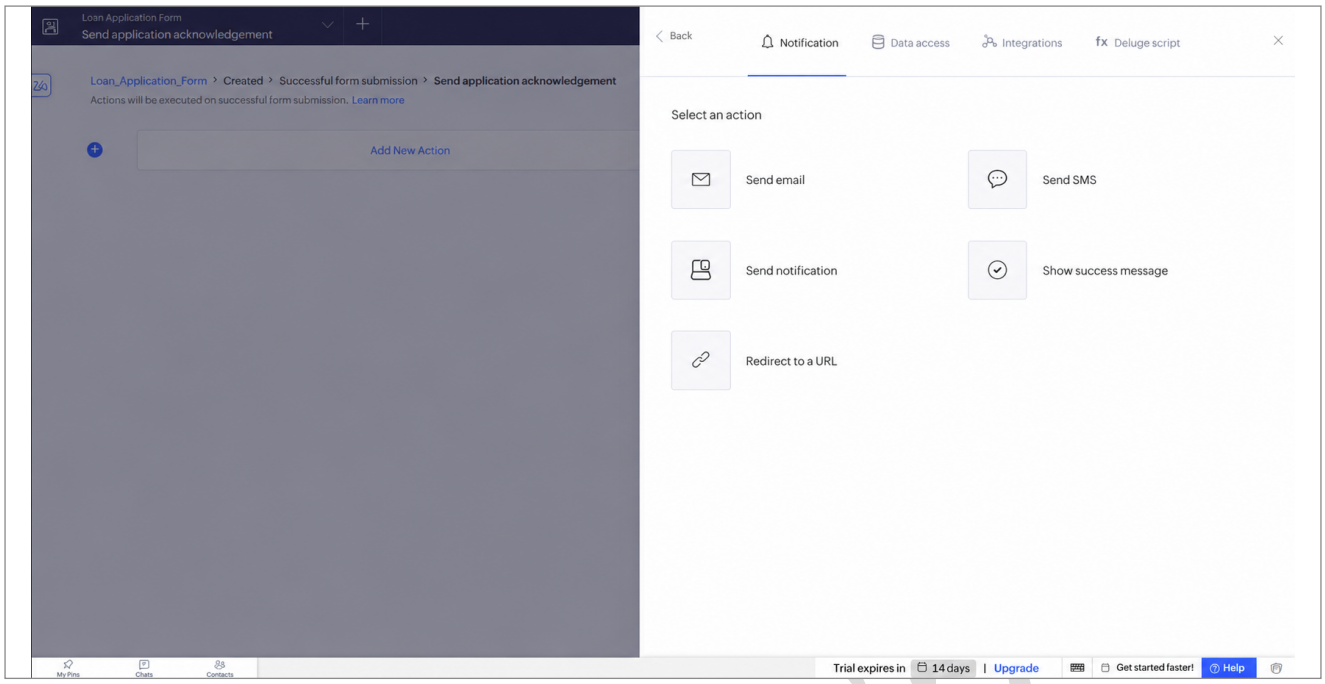

Figure 2: Selecting the Send email notification action

3.3 Configure the Email Template

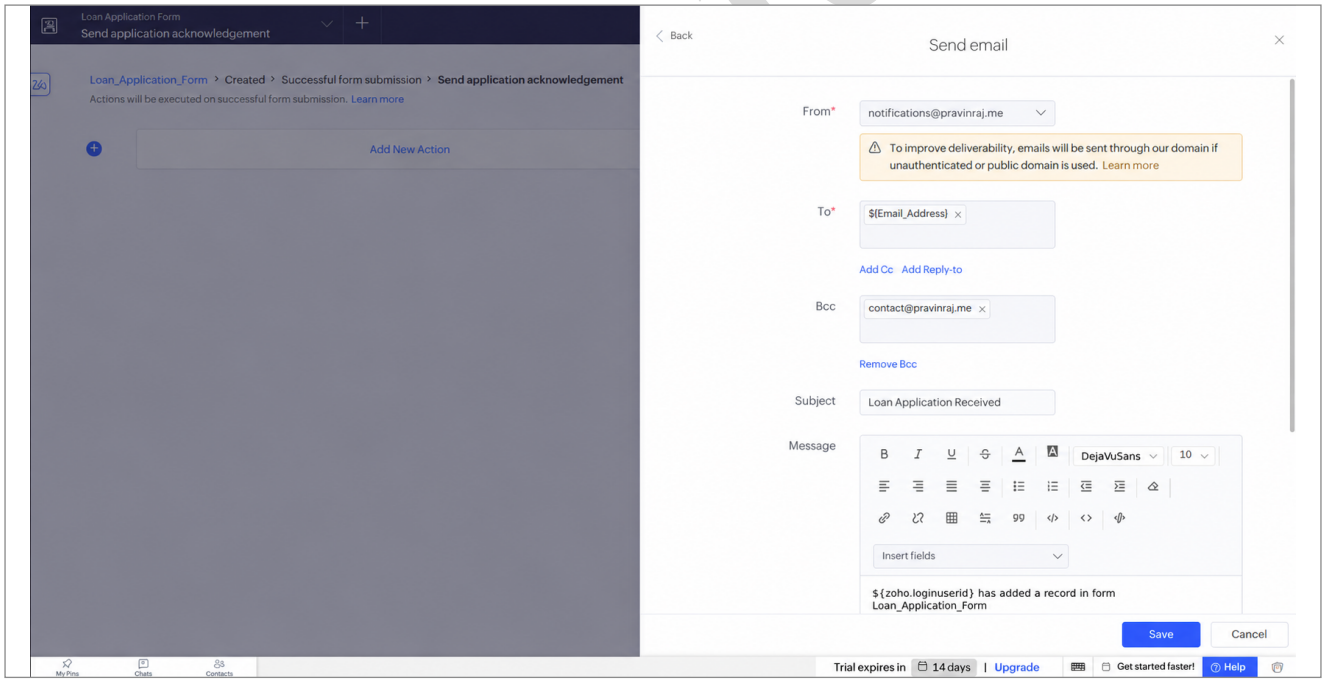

Figure 3: Email action configured for the applicant's Email_Address

The subject and message use loan-application wording. Administrative Bcc should be retained only when required by policy and protected from unnecessary distribution.

3.4 Final Workflow Canvas

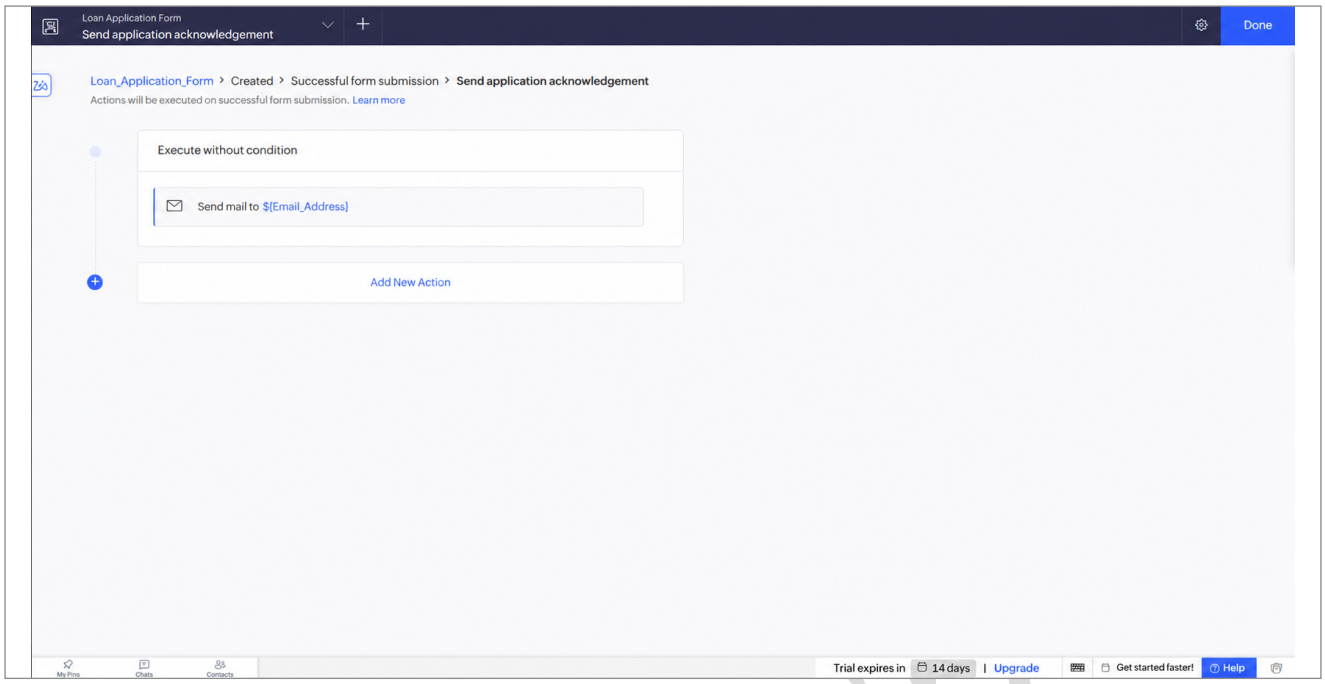

Figure 4: Enabled email action on the successful-submission path

3.5 Workflow Directory

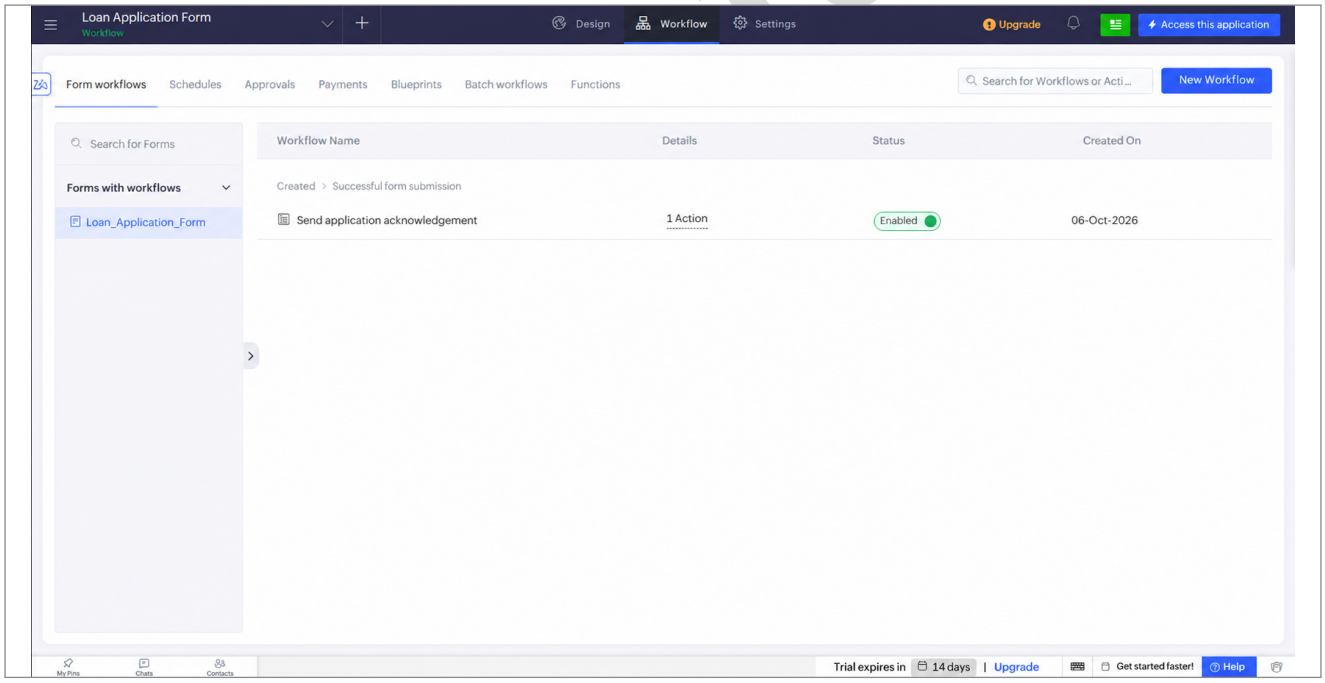

Figure 5: Loan_Application_Form acknowledgement workflow shown as Enabled

The directory view confirms the workflow definition and status. Delivery must still be verified through the email evidence and workflow logs.

3.6 Delivered Acknowledgement Email

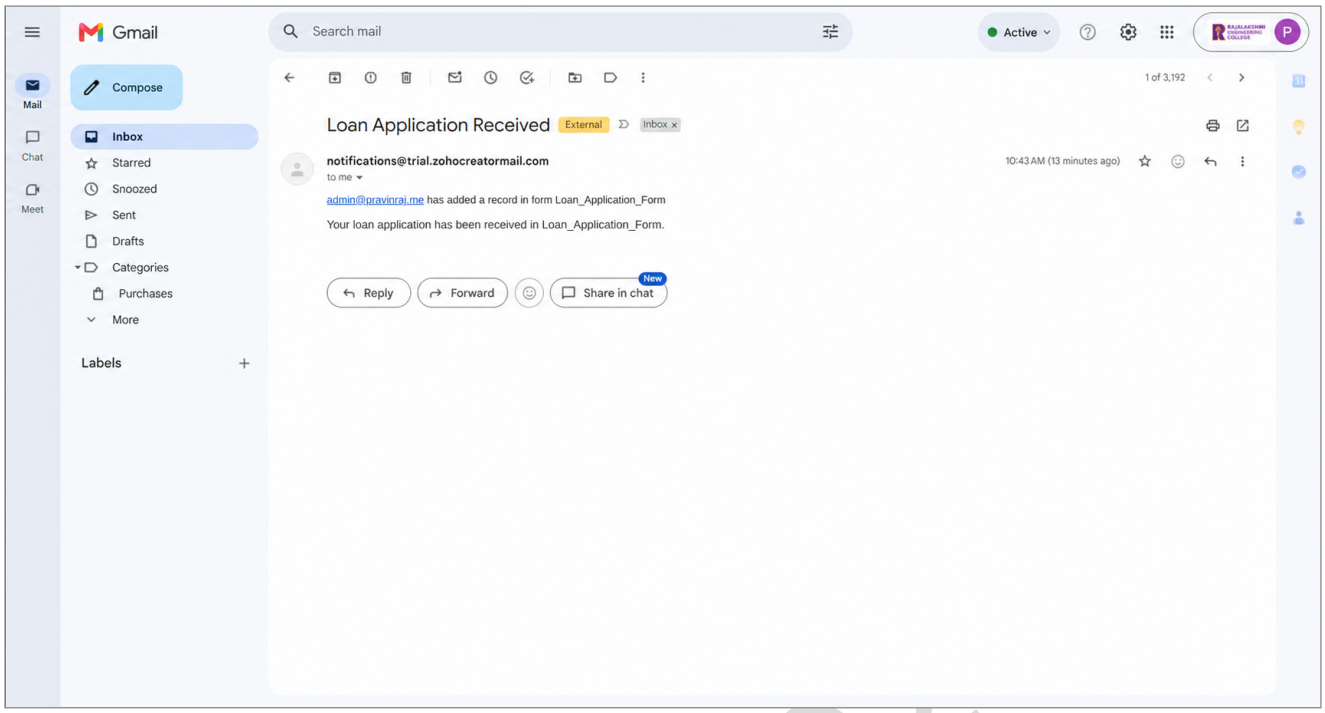

Figure 6: Applicant inbox showing “Loan Application Received”

4. Result / Observations

1. A creation workflow is associated with Loan_Application_Form after successful form submission.
2. The notification action sends an acknowledgement to the dynamic Email_Address value.
3. The edited workflow screens consistently use Loan Application Form, Loan_Application_Form, and Send application acknowledgement.
4. The delivered message confirms receipt while avoiding approval language and unnecessary financial data.
5. Workflow status, delivery evidence, and failure logs together provide the required end-to-end verification.

Final Test Record

Check	Pass condition
Trigger	Runs only after a valid new application is created
Recipient	Matches the submitted Email_Address
Content	Acknowledges receipt and states the next step
Privacy	Contains no PAN, income, liabilities, or bureau result
Delivery	Inbox or mail log confirms the message
Failure handling	Loan record remains available for officer review
