Exp 5: Building Reports, Dashboards, and Custom Pages (UI Builder) for the Application

1. Aim

To create operational reports and a custom dashboard for the **Loan Application & Pre-Screening Management** application using Zoho Creator Kanban, Calendar, report, and Page Builder components.

2. Reporting Objectives

- Group applications by Loan Type for product-wise review.
- Provide an intake calendar using Added Time while keeping Preferred Callback Time visible to reviewers.
- Summarize application volume by loan product and employment type.
- Embed Loan_Application_Report for record-level follow-up.

3. Components

Component	Name	Primary use
Kanban report	Loan_Type_Kanban	Groups applications by Loan_Type
Calendar report	Loan_Application_Calendar	Shows applications by Added_Time
Custom page	Loan_Application_Dashboard	Displays KPIs, charts, and report data
Embedded report	Loan_Application_Report	Supports applicant-level review

4. Data Use

The dashboard derives its views from Loan_Application_Form. Because the source model contains Preferred Callback Time but no callback date, the calendar uses the system Added_Time field for the event date and keeps the preferred time in the record details. Counts and charts should respect the viewer's record permissions.

5. Procedure

Phase A: Loan-Type Kanban

1. Create a Kanban report based on Loan_Application_Form.
2. Group columns by Loan_Type and name the report Loan_Type_Kanban.
3. Show Applicant_Name, Contact_Number, Employment_Type, Monthly_Income, and Preferred_Callback_Time on cards where space permits.

Phase B: Application Calendar

1. Create a Calendar report from Loan_Application_Form.
2. Use Applicant_Name for the event title and Added_Time for the event start and end date.
3. Name the report Loan_Application_Calendar and include Preferred_Callback_Time in the record view.

Phase C: Dashboard Page

1. Create Loan_Application_Dashboard in Page Builder.
2. Add KPI cards for Total Applications, Home Loans, Personal Loans, and Education Loans.
3. Add Loan Type Distribution and Employment Type Distribution charts.
4. Embed Loan_Application_Report with applicant, contact, loan type, income, and callback fields.
5. Preview the page and confirm that its counts match the underlying authorized report records.

6. Recommended Controls

- Restrict dashboards and detailed reports by role; mask or omit sensitive identity data when it is unnecessary.
- Keep aggregate charts consistent with the same filters applied to the embedded report.
- Use clear empty states and validate date, currency, and time formatting before publishing.

7. Output

7.1 Loan-Type Kanban

The Kanban configuration groups Loan_Application_Form records by Loan_Type. The live view presents one column per loan product for fast product-wise review.

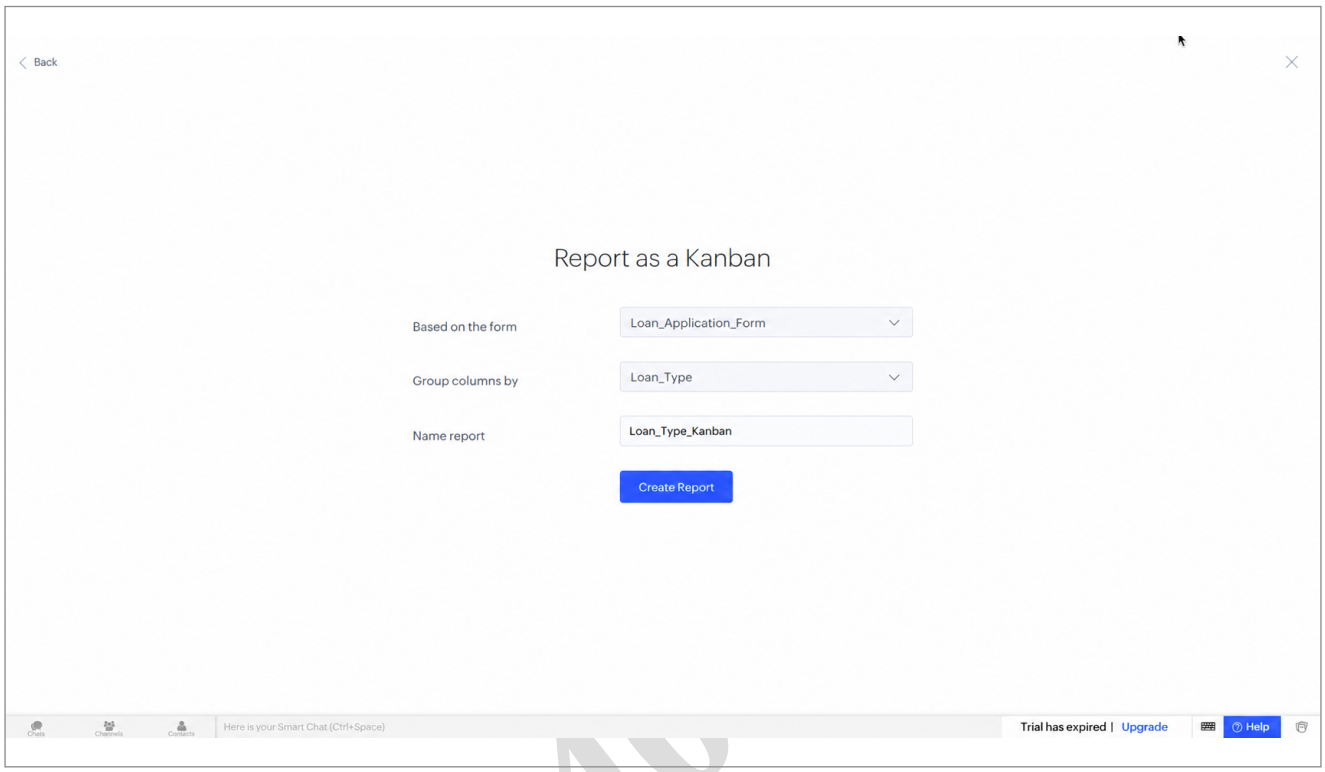

Figure 1: Configuring Loan_Type_Kanban

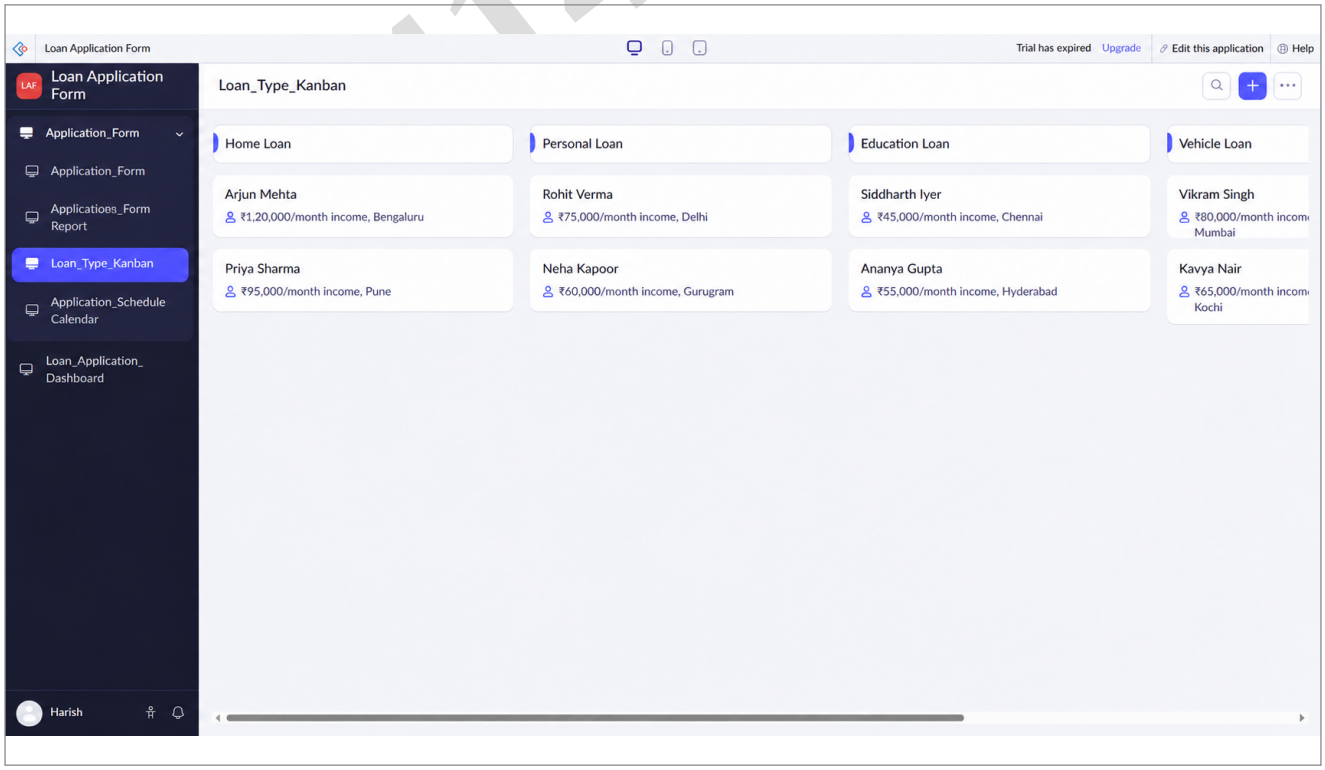

Figure 2: Loan applications grouped by loan type

7.2 Application Calendar

The calendar uses Applicant_Name as the event title and Added_Time as the intake date. Callback preference remains available in the related application record.

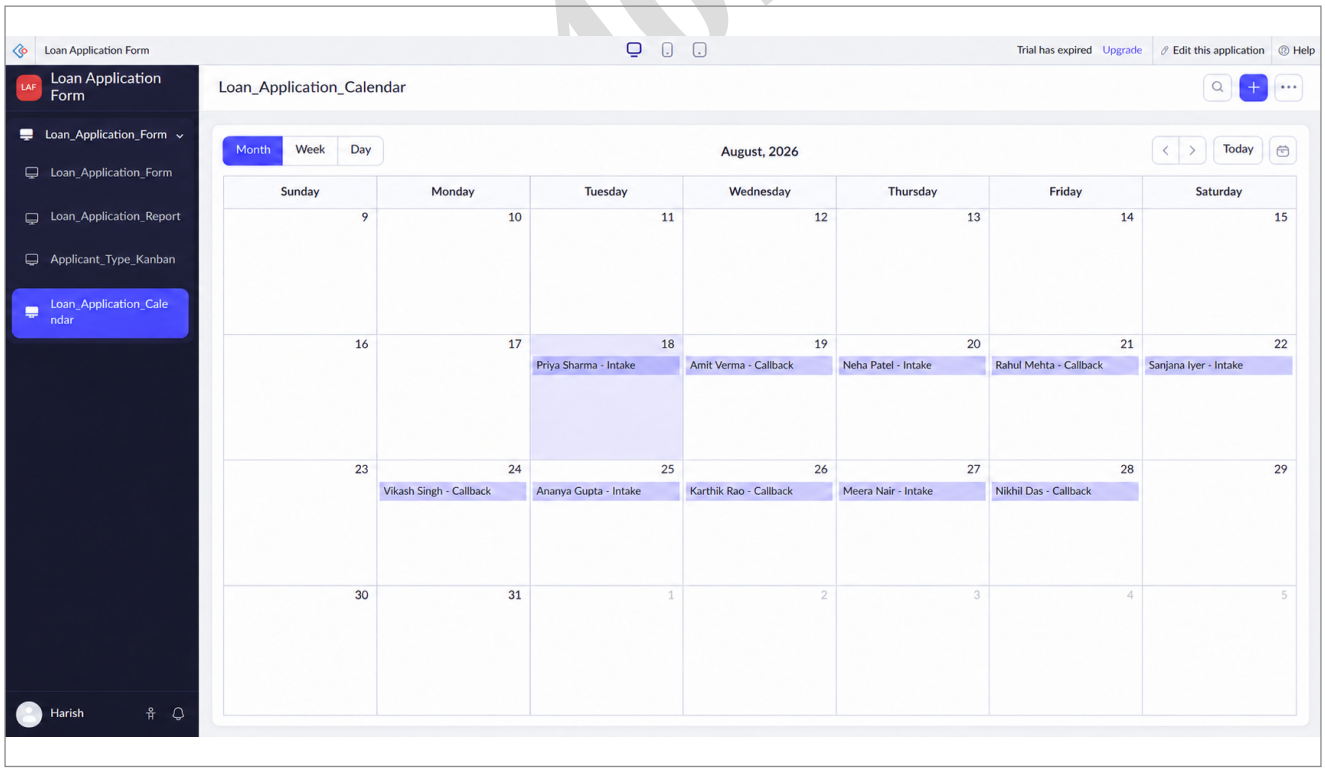

Figure 4: Calendar view of loan application intake

7.3 Dashboard Page Builder

The custom page combines KPI cards, distribution charts, and record data in a single operational view.

7.4 Embedded Application Report

The detailed view joins summary charts with Loan_Application_Report, giving reviewers a path from aggregate patterns to individual applications.

8. Result

- Loan_Type_Kanban organizes applications by requested product for faster routing and review.
- Loan_Application_Calendar provides a date-based intake view without inventing a callback date that is absent from the form model.
- The dashboard summarizes application volume and employment mix while retaining access to authorized record detail.
- Published results should be reconciled with Loan_Application_Report and tested under each user role before operational use.
